12. Tableau Worksheet Design

Proposed worksheet set

Sheet | Question | Fields / measure | Suggested chart | Design note

01 | Records by vehicle category | category; COUNT(vehicle_id) | Sorted horizontal bar | Show record count and % of dataset

02 | Records by market region | market_region; COUNT(vehicle_id) | Bar or map only if geography is validated | Do not interpret count as regional market size

03 | Price distribution | price_usd | Histogram and box plot | Show USD and median; review outliers

04 | Price by category | category; MEDIAN(price_usd) | Sorted bar | Median preferred due to skew

05 | Range by category | category; MEDIAN(range_km) | Bar / box plot | Use km and category sample sizes

06 | Battery capacity vs range | battery_capacity_kwh; range_km | Scatterplot | Color by category or battery type

07 | Price vs battery capacity | price_usd; battery_capacity_kwh | Scatterplot | Association only; outliers visible

08 | Efficiency distribution | efficiency_wh_per_km | Histogram / box plot | Check extreme values

09 | Sales distribution | annual_sales_units | Histogram or percentile plot | Document nulls and extreme values

10 | Ratings overview | customer_rating; safety_rating_stars | Distribution charts | Do not merge separate rating scales

11 | Battery types | battery_type; COUNT(vehicle_id) | Bar chart | Record composition, not adoption share

12 | Model-year profile | model_year; COUNT(vehicle_id), AVG(range_km) | Line/bar combination only with clear axes | Not an industry sales trend

Build standards

- Use meaningful worksheet names rather than “Sheet 1”.
- Sort categorical bars by the selected metric.
- Format USD as currency and physical measures with units.
- Display sample size when comparing groups.
- Use a consistent, accessible palette.
- Test filters with null values and extreme records.
- Add informative tooltips with definitions and record count.
