21. Demo and Presentation Script

Suggested 5–7 minute demonstration

1. Introduction (30 seconds)

“Hello. My project is **Electric Vehicle Market Performance & Insights**. It uses a supplied EV dataset and Tableau to make vehicle specifications and selected market-related fields easier to explore.”

2. Problem and objective (40 seconds)

“The dataset has 100,000 records and 37 fields. Manually comparing its manufacturers, categories, battery specifications, prices, ranges, and other fields is difficult. The objective is to profile the data, visualize selected patterns, and explain the limitations.”

3. Dataset overview (45 seconds)

“The file covers model years 2018 to 2026, with 200 manufacturer labels, 15 categories, and 7 market regions. The raw file contains 9,511 missing cells. I checked duplicate rows and vehicle IDs; neither check found duplicates.”

4. Methodology (45 seconds)

“The workflow is data profiling, quality checks, exploratory analysis, Tableau worksheet design, dashboard creation, story sequencing, website integration, and testing. I use both mean and median where outliers may affect averages.”

5. Dashboard walkthrough (90 seconds)

“Here are the overview KPIs and the category and region distributions. These counts describe the records in the file; they should not be interpreted as real market shares without source validation. Next, the price and range comparisons show differences across categories. The relationship chart compares battery capacity and range. In the raw data, their Pearson correlation is 0.266, which describes association rather than causation.”

6. Story walkthrough (60 seconds)

“The story starts with the dataset context, moves to category composition, compares price and range, then discusses relationships and data limitations. The average price is $65,010.46 and the median is $42,808.69; their gap indicates that high-priced observations influence the mean.”

7. Website (40 seconds)

“The webpage provides the project overview and embeds the Tableau dashboard and story. If the embedded view does not load, the direct Tableau Public links can be used.”

8. Conclusion and caveats (30 seconds)

“The project demonstrates how descriptive analysis and interactive visualization can make a wide dataset easier to understand. The data source and some metric definitions were not provided, so the results are limited to this file and do not independently prove market-wide sales, emissions savings, or consumer behavior.”

Likely viva questions

Q: Why use Tableau?

A: It supports interactive charts, filters, dashboards, and a story sequence that makes comparisons easier to explore.

Q: What is the biggest data-quality issue?

A: Missing values in four fields and extreme values in fields such as annual sales, price, and efficiency. The source definitions need verification.

Q: Does record count equal market share?

A: No. Record counts describe the supplied file. Market share requires validated market totals and a clear sampling/measurement basis.

Q: Does correlation prove causation?

A: No. Correlation describes association and may be influenced by other variables or data-generation choices.

Q: Why report median as well as mean?

A: The median is less sensitive to extreme values, which is useful for skewed fields such as price and annual sales.

Q: What would you improve next?

A: Verify provenance, confirm metric definitions, investigate outliers, validate calculations against an authoritative source, and conduct browser/device testing of the published embeds.
